

My thoughts on caches:

First a couple of observations:

Get a good pick and shovel, plus a small shovel or e-tool, which should be oiled and put in a zip-

so it can be kept close to the ground. Watch the compass needle. When close to one of these powerful magnets the compass needle will deflect and the magnet can be located. Then with the location of the actual cache determined.

When the time comes to recover the cache, middle of the night, blowing rain, trying to snow, with five guys and two mean dogs after you, recover the broomstick, dig up the trowel, scoop the thin layer of surface dirt free of the sheet plastic, scoop out the easy to move sand off(to)-3( )-4.iF1 15.96 Tan ofca

Just leave the surface of the ground in the same condition as it was when you set up the tipi and no one should be any the wiser. Carry out the excess dirt in the same buckets in which you brought the sand.

The basics of caching drums are very similar to those for bucket caches. But there are some differences. Here are some things specific to the drum caches (This refers to open top drums with sealable lids, not drums for liquids with bungs.):
